XWID

The Extract Workforce Investment Act Data (XWID) is a program used to extract the individual characteristics of Workforce Investment Act (WIA) clients to be used in reporting, by the State of California, to the United States Department of Labor (DOL).

Purpose and Frequency

This program is used to create a file that will be transferred to the Workforce Investment Division (WID) in a format that matches what is found in the WID database. The program must be run **monthly**, and automatically creates reports **quarterly**. This data will reside in a quarterly report table.

Edits and Errors

The program will run edit checks for all fields. If any record fails the required edits, a description of each error will be written to a report for the Local Workforce Investment Area (LWIA) to reference. The report will have the name “XWID MM/YYYY *datetime*” and will be written to RIOH.

Options (View or Create)

If there are no errors, LWIA's will have the option to create the extract or just view it.

Viewing will be helpful to LWIA's who want to ensure that they are always extracting the cleanest data possible.

If **Create** is chosen, then the extract will load the data into Individual Participant Data (IPD) tables that exists on both the local and State sides. Only records that are new or have been modified will be updated in the tables. There will be an edit to check if all records that exist on the local side exist on the state side, this means that a record that has been deleted from the local side will be deleted from the State side. This will insure that data will match in both tables.

The program can be run as often as needed for viewing, but should only be run monthly for creation of the extract.

Steps for running XWID

XWID	Extract WIA Data
Enter Ending Period (MM/YYYY): !!!!!!!	

Step 1. Enter mnemonic: XWID

Step 2. Enter the ending date for the period: month/year

Step 3. <File> the XWID

Step 4. If no errors are found, the system will display this prompt: "Create extract file now? (Y/N)". If answer is "Y", then the file will be committed to the LWIA database and file will be named XWID_SDA_YYYYMM_99.xtr. If file for this period exists, system will prompt: "Extract file already exists for this period. Continue anyway (Y/N)?". If "Y" then file will be given a revision number starting with 01.

Step 5. If errors do exist, then the RIOH (Report Input/Output Handler) window will pop up so you can either display or print the error report.
